Summary

Full-stack engineer bringing 2+ years of production experience shipping real products. I've built the systems behind complex workflows and data dashboards, which means I design with a genuine instinct for what's technically feasible, how engineers think, and what actually serves users. Proficient in Figma, experienced in conducting user research, and drawn to products where the design problems are hard and the stakes are real.

Design & Technical Skills

Design & UX: Figma, Wireframing, Prototyping, User Research, Usability Testing, Workflow Mapping, Story Mapping, Design Systems

Engineering: React, Angular, TypeScript, Python, C#, ASP.NET Core, Node.js, REST APIs, PostgreSQL, AWS

Methods & Tools: Agile, Cross-functional Collaboration, Design-to-Build Handoff, AI-Native Workflows, Anthropic Claude API, Prompt Engineering

Projects

Optimizer | *TypeScript, Angular, C#, ASP.NET Core, REST API, MySQL, Figma*

- Identified that staff were losing hours to manual data extraction, then designed and built a scheduling dashboard that **reduced extraction time by 58%**, reframing raw operational data into something people could actually act on
- Led the full design process: mapped user workflows, wireframed key screens in Figma, validated with stakeholders, then implemented and owned both design and engineering, sole engineer from concept to launch
- Designed for non-technical users managing high-stakes scheduling data, applying progressive disclosure and clear visual hierarchy to reduce cognitive load across dense, multi-state workflows
- Partnered closely with non-technical stakeholders throughout, running impromptu feedback sessions to validate design decisions before they became code, the same loop I'd run in a formal sprint environment

TasteMind | *Node.js, Anthropic Claude API, Google Places API, PostgreSQL, React, Figma*

- Designed an AI-powered discovery experience where the core UX challenge was that users needed to believe the recommendations were real and personal, not generic AI output; solved this through a **feedback loop that only persists data after a real interaction**, making improvement visible over time
- Designed the location input UX to handle ambiguity gracefully, building a validation layer that resolves unclear inputs before any API calls fire, prioritizing a clear, honest error state over a silent failure
- Built the full responsive interface, making deliberate layout decisions about information hierarchy between the craving input view and results view to minimize friction at the moment of highest user intent

Experience

Full Stack Software Engineer

2022 – 2024

StatRad, LLC

Poway, CA

- Owned the experience of internal tools used daily by non-technical staff, identified pain points with stakeholders, designed the solution, shipped it, and iterated; **reduced organizational inefficiencies by 40%**
- Partnered with engineers and non-technical stakeholders to translate complex system behavior into accessible language, keeping product decisions grounded in actual user needs rather than technical convenience
- Resolved **50+ production issues** through root cause analysis and systematic debugging, reducing downtime by **20%** and built a strong instinct for designing around edge cases and failure states from the inside out
- Deep experience pairing with engineers on implementation feasibility, giving me fluency in the handoff that most designers only learn over years of cross-functional collaboration

Bartender

2022 – Present

NOLA

San Diego & Palo Alto, CA

- Managed high-volume customer interactions requiring active listening and adaptations

Education

University of San Diego

Bachelor of Arts in Computer Science

Leadership

Association for Computing Machinery

Outreach Chair

- Built and managed **150+ professional relationships** and coordinated **18+ industry panels**, developing strong instincts for communicating value clearly across technical and non-technical audiences with the same skill needed to advocate for users in a cross-functional product team
- Facilitated **15+ technical sessions** breaking down complex concepts for diverse audiences, sharpening the ability to bridge user needs and engineering implementation
